One of the most exciting and fascinating features in Dermatology is the various presentation of color, distribution, morphology, pattern, and clinical course of the skin lesions. In this coming issue, we launched two new article types: **Clinical and medical images** and **Therapeutic Hotline Letters**. We hope through these two new sections, the journal will become more successful and inspiring than ever.

In the **Clinical and medical images** section, Bakardzhiev I, et al [1] reminds us the unusual presentation of serial multiple genital ulceration of *ulcus durum* may be considered super infection or re-infection of primary syphilis in patients with repeated and indiscriminate casual unprotected sexual contacts.

In the **Therapeutic Hotline Letters** section, Tchernev G et al [2] presented a case with huge "Shuriken-like" superficial spreading malignant melanoma without locoregional metastasis. They speculated that congenital or acquired defects in T-cell immunity with the persistence or delayed elimination of certain T-cell clones, similar to the effect of current target therapies PD-1 receptor and CTLA-4 inhibitors, may explain the lack of

progression in certain giant melanoma.

Finally, Persechino S et al [3] showed the safety of etanercept administration to a patient with psoriasis, concomitant HCV infection, mild liver disease, and signs of previous contact with HBV. Since the biological therapy is becoming the standard treatment for psoriasis and psoriatic arthropathy, more data on anti-TNF α drug safety in active HCV patients with concomitant previous HBV contact are mandatory.
